MARKDOWN INPUT

That classic "Permission denied" error usually happens for one of two reasons: either the `**script` file isn't executable**, or the shell `**needs` administrative root permissions**.

Here is how to fix it based on what you are trying to do:

Scenario A: Executing a ``.sh`` or ``.py`` file directly

If you tried running ``.sh`` or ``.py`` and got ``Permission denied``, the file is missing execution permissions.

1. Make the file executable

Run ``chmod +x`` on the file to grant execute permissions:

```
```bash
chmod +x script.sh
```

```
```
```

Then try running it again:

LIVE PREVIEW

```
# or
./script.sh "$(pbpaste)"
```

2. Bypass by calling the interpreter directly

Alternatively, you don't need execution permissions if you explicitly invoke the program handling it:

```
# For bash scripts
pbpaste | bash script.sh

# For python scripts
pbpaste | python3 process.py
```

Scenario B: System / Root protection

If the script is trying to modify system files, install packages, or access protected directories, standard user privileges won't be enough.

Prepend `sudo` to run the command with administrator rights:

```
# If piping clipboard content into bash:
pbpaste | sudo bash
```
