User prompt: What's today's date?

Response: Today is Tuesday, September 8, 2026.

Sources

- 1. [What Is Today's Date? What Day Is It? - Saturday Gift](#)

User prompt: Create a table of columns and rows of terminal commands, providing 5 options.

Response:

Command	Description	Example Usage
ls -la	Lists all files, including hidden dotfiles, in a detailed long format.	ls -la ~/Documents
df -h	Displays available disk space and volume usage in a human-readable format.	df -h
find	Searches for files and directories within a directory tree based on specified criteria.	find . -name "*.json"
pbcopy	Copies data from standard input directly to the system clipboard (macOS).	`cat config.json
top	Displays real-time active system processes, CPU load, and memory usage.	top -o cpu

User prompt: How to execute a js file

Response: Execute a JavaScript file using Node.js in the terminal or by running it through a web browser using an HTML file.

1. Using Node.js (Terminal)

The standard way to run a standalone JavaScript file from the command line is with Node.js.

egbbe

1. Open your terminal and navigate to the directory containing your file:

```
cd /path/to/directory
```

2. Run the script using the `node` command:

```
node script.js
```

(Note: If you need to check whether Node.js is installed, run `node -v`.)

2. Using a Web Browser (HTML)

For scripts that interact with the Document Object Model (DOM) or web APIs, link the file inside an HTML document and open it in any browser.

1. Create an HTML file (e.g., `index.html`) referencing your script:

```
<!DOCTYPE html>
html lang="en">
<head>
  <meta charset="UTF-8">
  <title>Run JS</title>
</head>
<body>
  <script src="script.js"></script>
</body>
</html>
```

2. Open `index.html` in your browser, or use a terminal shortcut to open it (on macOS):

```
open index.html
```

3. Using macOS JXA (JavaScript for Automation)

Because you are on a Mac, you can also execute native automation scripts written in JavaScript directly from the terminal without installing Node.js, using the `osascript` utility:

```
osascript -l JavaScript script.js
```
